SKILLS	Unreal Engine, Unity, Godot, C/C++, C#, Rust, JavaScript, React, GDScript, Python, Perforce, Git, SVN, LLM Integration, Jira, Confluence, PS5 SDK, Steam SDK	
PROFESSIONAL EXPERIENCE	Game Tech R&D Engineer Nov 2023 – Present Tencent London, UK Confidential AI-Driven Roguelike (Godot 4) - Developed multiplayer gameplay systems for a confidential roguelike exploring how AI can influence gameplay mechanics and session flow. - Built and maintained server-authoritative networking using Godot’s multiplayer framework, supporting dedicated-server and listen-server architectures. - Implemented core multiplayer systems, including replicated enemy spawning, player health, death and respawn, a reusable objective framework, session currency, and synchronized choice-door route selection. - Built early meta-progression systems covering player profiles, shops, persistent item storage, item ownership, and pre-run loadouts. - Designed scalable, data-driven architecture using node-based run structures, event-driven interactions, and server-owned session-state management. - Built shared event-routing and validated action-dispatch systems that expose structured gameplay events and safe actions to AI-facing systems. - Partnered closely with designers to develop timeline-driven gameplay infrastructure and editor tooling for authoring triggers, pacing events, action parameters, and session behaviours. - Currently contributing to AI-system design by defining the player, world, and session data required to support context-aware gameplay decisions. Tech: Godot 4, GDScript, GodotSteam, LLM integration, event-driven architecture, editor tooling. Confidential AI Gaming Companion - Led client-side development of a cross-platform AI gaming companion application using Tauri v2, Rust, React, and TypeScript. - Evaluated Electron and Tauri through proof-of-concept implementations, recommending Tauri based on runtime performance, application footprint, and desktop-integration requirements. - Designed and implemented a dual-mode user experience combining a full conversational interface with a lightweight companion mode for use during gameplay. - Built a multi-window architecture supporting main, companion, avatar, and settings contexts, including borderless windows and custom drag regions. - Integrated desktop-native features including tray support, global hotkeys, clipboard image workflows, transparent overlays, screen capture, and gRPC/Three.js avatar communication. - Implemented animated companion and external-avatar workflows using PixiJS, Three.js, and gRPC communication. - Delivered Windows and macOS builds through automated packaging pipelines with feature-flagged Steam SDK integration.
